Executive Summary

This document describes the research priority and the Strategic Research Agenda (SRA) for Social Sciences and Humanities (SSH) in radiation protection for the next 20 years. It is a live and constantly developing text that will be modified according to the state-of-the-art and societal needs. This will be done by a continuous engagement of the SSH community in radiation protection field and other stakeholders, especially technical and research platforms. To this end, the SSH community in radiation protection field will structure and enhance dialogue at the European level among the different stakeholders, fostering the sharing of knowledge and information among various disciplines working on aspects of radiation protection and identify the SSH research needs in the field of radiation protection.

This strategic research agenda is a “self-standing” SRA and, although it has common points, it is not included as such in other platforms' SRAs. The integration of SSH topics in the existing platforms’ SRA is a parallel action to this self-standing SSH SRA. These two actions facilitate a coherent integration of SSH in European radiation protection programmes and guide the process of preparing calls in this field.

Moreover, the SSH community in the CONCERT project stimulates a better integration of social sciences and humanities (SSH) in research, practice and policy related to ionizing radiation, including a wide variety of topics such as low dose risk, radioecology, emergency preparedness and response, dosimetry, medical applications, radioactive waste management, nuclear energy production, safety, NORM, site remediation.

The objective of Strategic Research Agenda (SRA) for Social Sciences and Humanities(SSH) in radiation protection is to contribute towards improvement of the Radiation Protection (RP) system by coordinating European research in the field of SSH in radiation protection; supporting education and training; knowledge management and sharing; and identifying SSH state of the art across domains. It is only by enabling SSH research to play a fuller and stronger role through a coordinated SRA mechanism that societal perspectives on research relating to radiation protection will be realised.

The underlying principles of the SSH SRA are that:

- SSH can support existing and future research, policy and practice, in all areas relating to radiation protection to take into account better the concerns, values and needs of a wider range of stakeholders, including citizens and communities;
- the findings of social sciences and humanities (SSH) research should be co-ordinated, shared and integrated in European research and development on radiation protection;
- the research relating to radiation protection should be conceived as transdisciplinary and inclusive, integrating citizen, science and stakeholder input from the start.

With these principles in mind, the SSH strategic research agenda will support identifying the priorities for future European SSH research in the field of radiation protection.

I. Challenges

The need for multi- and transdisciplinary research and broader societal involvement in radiation protection is increasingly recommended at national and supra-national levels for all aspects of exposures to ionising radiation.

This strategic research agenda aligns with recent proposals for more open and responsive modes of research and science policy-making, and attends to the following challenges put forward in contemporary EU-wide policy discourses on “Science with and for society” and “responsible research and innovation”:

- Health and wellbeing
- Secure, safe and resilient societies
- Communication, collaboration and citizenship
- Integration, impact and reflexivity

Health and wellbeing comprises the mental and physical of individuals and the social health of populations. Achieving health and wellbeing requires investments on behalf of decision makers and research communities at a time of economic restraint and the aging of populations across Europe. Research in the field of SSH explicitly addresses these aspects and draws connections between health and wellbeing to ensure quality of life for all.

European nations face major natural hazards and human-induced threats. SSH research seeks to make significant contributions towards enhancing societal resilience and preparedness in the face of these threats by examining contemporary approaches to safety and security, and by opening a broader societal debate on the kinds of resilience that can, and should, be achieved.

SSH research on communication, collaboration and citizenship advances our understanding of how individuals and people are included and excluded, and how processes like communication and collaboration foster novel forms of identity, sensemaking and belonging. It does so with the aim of creating societies in which citizens thrive and feel confident to express themselves.

SSH research on integration, impact and reflexivity assesses the impact of research activities on the values and choices made by researchers in their communities. This includes giving due consideration to the societal and ethical implications of research agendas, processes, and outputs.

Recognizing the intertwined character of social and technical resonates with the idea that science and technology are open to individual creativity, collective ingenuity, economic priorities, cultural values, institutional interests, stakeholder negotiation, and the exercise of power and it is thus important to reflect on how this shapes the organisation of radiation protection research and the formulation of its policies.

This SRA for Social Sciences and Humanities Research in radiation protection is structured in six research lines for which a joint European effort has been identified as key to addressing the contemporary challenges outlined above. Each of these research lines includes a number of specific research topics relevant to a future European research agenda in the field of radiation protection.

Creating and updating the SRA for social Sciences and Humanities is a live and constantly developing process and the output will be regularly adopted according to the state-of-the-art and societal needs. This will be done by a continuous engagement of the SSH community in radiation protection field and other stakeholders, especially technical and research platforms.
II. Working Method

The research topics were collected through activities carried out in the H2020 projects CONCERT and the FP7 projects OPERRA, PREPARE and EAGLE (notably the RICOMET 2015 and 2016 conferences and Symposium on Ethics of Environmental Health), as well as in dialogues with members of the radiation protection platforms, carried out in a context of the CONCERT 2.6 task group. The collection of the research topics was discussed at the Radiation Protection Week in Oxford (19-23 September 2016) with task 2.6 members, SSH community and platforms, and the most urgent topic for an SSH research was identified. (For a detailed methodology see the CONCERT deliverable 2.2, 2015)

The final prioritisation for the 2nd CONCERT call was done by the following active discussants at the task 2.6 meeting in Oxford: S. Saloma, STUK; G. Baumont, IRSN; T. Lazo, OECD/NEA; P. Simmons, UEA, D. Brazien, Environoment Agency; C. Schriber, CEPN; M. Meitre, CEPN; E. Salminen, STUK; M. Martell, Merience; C. Mays, SYMLOG; I. Chaffel de Witte, IRSN; D. Luctte, IRSN; M. Nobuaki, Hiroshima University; F. Zolzer, USB; M. Gaston, SCK•CEN; T. Duranova, VUJE; M. Suric Mihic, IMROH; J. Malone, Trinity College; S. Baude, MUTADIS; P. Fattbene, ISS; S. Della Monaca, ISS; T. Schnider, CEPN; M. C. Cantone, UNIMI; C. Turcanu, SCK•CEN; C. Plozl-Viol; BfS; Y. Tomkiv, NMBU; D. Oughton, NMBU; I. Prlic, IMROH; T. Perko SCK-CEN

III. Statement on the SSH research priority for the 2nd CONCERT call

In order to elicit priorities for the different SSH topics included in the draft SSH SRA a questionnaire was drafted and distributed to all participants at the Radiation Protection Week in Oxford (19-23 September 2016). In addition, a special discussion session was held with CONCERT task 2.6 members and invited participants during the same event.

Subsequently, the selection of the SSH priority topic(s) to be included in the second CONCERT call was based on: i) the discussion among task 2.6 members and ii) the feedback received from the participants at the Oxford week that filled in the questionnaire. Based on this input, a preliminary list of the most important research themes was identified, as follows. The references to the draft SSH SRA refer to the SRA for SSH radiation protection research, revised after the Oxford workshop.

1. Stakeholders’ sense-making of ionising radiation concepts, risks, uncertainties (topic 1.5 in draft of SSH SRA) and link with behaviour in different exposure situations. Possibly focus on low doses and include risk communication, mental models.
2. Legal instruments for public information and participation (topic 4.3 in draft SSH SRA) and their application. Analysis of participatory tools and methodologies (4.4 in draft SSH SRA), in particular ethical principles guiding deliberative processes (4.9 in draft SSH SRA).
3. Analysing and increasing awareness of radiation protection R&D (3.1 in draft SSH SRA) and ethical principles guiding RP research (3.4 in draft SSH SRA); harmonisation of radiation protection approaches.
4. Holistic approaches to accident management (psychological aspects and socio-economic aspects) (2.3 in draft SSH SRA) and role of local knowledge in decision-making (2.7 in draft SSH SRA).
5. Ways to build/ transmit radiation protection culture (line 6 in draft SSH SRA) => transversal
issue (can be integrated in many of the above)

6. Risk communication for medical applications (5.1 in draft SSH SRA) specific topic => to be discussed with the medical platform?

[7. Stakeholder collaborative framework (4.2 in draft SSH SRA) => more a CSA than a RIA topic?]

This list of SSH themes was subject to a second round of discussions among task 2.6 members and the draft SSH proposal for the second CONCERT call was assembled based on topics 1 and 2 from above, which were clearly highlighted as the research priorities.

The priority for SSH research in the field of radiation protection is formulated as follows.

**Title:** Models, tools and rationales for stakeholder engagement and informed decision-making in radiation protection research, policy and practice for situations involving exposures to ionising radiations.

**Challenge**

Governance of radiological risks is challenged by the particularities of ionizing radiation (e.g. scientific and societal uncertainties, different perceptions of risks, societal trust issues) and the evolving European societal landscape (e.g. new mass media, active citizenship). To address this, research on new models, tools and rationales of stakeholder engagement in radiation protection research, policy and practice is needed, for different exposure situations. Although a number of national and international recommendations and legal requirements for stakeholder engagement in radiation protection (e.g. Basic Safety Standards, Aarhus Convention) have been developed, there is still a big gap between discourse and practice, as highlighted for instance by FP7 projects EAGLE and PREPARE. In addition, the increasing capacity of organised civil society stakeholders and citizens to investigate by themselves radiation protection issues and to produce knowledge poses new challenges for institutional actors in radiation protection to engage with non-institutional stakeholders and develop new models of interaction taking into account these social dynamics. The aim of this action is to improve the governance of radiological risks by enhancing stakeholder engagement and informed decision-making on multiple levels (e.g. institutional, non-institutional, individual), by clarifying the venues and instruments for stakeholder engagement, the factors that inform engagement (socio-psychological, political, economic, cultural, legal, ethical), and the impact of stakeholder engagement on justification, health and wellbeing.

**Scope**

Proposals will identify and address key challenges in stakeholder engagement and informed decision making in radiation protection, by analysing rationales and developing new models and tools for stakeholder interaction and engagement. This is needed for different exposure situations and categories of exposures, whether affecting an individual, groups of people, or larger communities. The proposal outcomes may include the analysis of societal needs for and evaluation of legal instruments and governance frameworks supporting access to information, public participation and access to justice in relation with radiation protection issues; the ethical principles guiding engagement and justification; and the examination, assessment and design of stakeholder and public participation tools and methodologies for different radiological exposure situations and categories of exposure. Proposal may entail highlighting roles and rules of stakeholders in the engagement process; the interaction between institutional and non-institutional stakeholders; factors facilitating engagement;
stakeholders’ sense-making of ionizing radiation concepts, risk and uncertainty (e.g. practitioners, patients, local population); impact of stakeholder engagement on the interplay of psychological aspects associated with radioactivity, social environment, culture and radiation protection behaviours; and the role of recent developments in communication including social media (e.g. citizens’ journalism).

**Expected impact**
The research should bring insights on ways to intensify responsiveness to societal needs and concerns, increasing the quality of radiation protection approaches, techniques and culture. It should improve the mutual understanding between stakeholders, and enable informed decision making. Proposals should reinforce the links between social sciences and humanities research and the radiation protection platforms (MELODI, NERIS, ALLIANCE, EURADOS and EURAMED) and help with disseminating and understanding stakeholder engagement processes. The research results should be applicable, for instance to support the implementation of Basic Safety Standards.

**Type of action**
Research and innovation. Project proposals may address the entire or part of the scope.

Additional details are given in the research template below.
IV. Research lines and topics in Strategic Research Agenda (SRA) for Social Sciences and Humanities (SSH) in radiation protection field (RP)

This SRA for Social Sciences and Humanities Research in radiation protection is structured in six research lines for which a joint European effort has been identified as key to addressing the contemporary challenges outlined above. Each of these research lines includes a number of specific research topics relevant to a future European research agenda in the field of radiation protection.

Research line 1: Effects of social, psychological and economic aspects on radiation protection behaviour and choices of different actors

RL1 seeks to improve the understanding of behavioural aspects related to radiological risks, including the interrelation between behaviour, perception of radiological risks, knowledge, culture, historical memory and other potentially influencing factors.

Relevant topics include:

<table>
<thead>
<tr>
<th>Topics</th>
</tr>
</thead>
</table>
| 1.1 Links between perception of radiological risk and radiation protection behaviour, or individual strategies to cope with perceived risk in relation to radiation exposure, using both cross-sectional and longitudinal studies focusing on one or more of these aspects:  
- different exposure contexts (workers, population living in areas affected by radiological contaminations),  
- different time scales (e.g. different generations),  
- cultural context,  
- socio-economic issues of behaviour change |
| 1.2 Comprehensive approaches to studying the perception of radiological risk and environmental remediation actions in post-accident and existing exposure situations. |
| 1.3 Social and traditional media impact on perception of radiological risk and general well-being linked to radiation exposures. This includes the influence of citizen journalism on radiation protection behaviour in different exposure situations and developing models for integrating scientific journalism in radiation protection. |
| 1.4 The interplay of psychological aspects associated with radioactivity, social environment and radiation protection behaviours. |
| 1.5 The understanding of ionizing radiation concepts, risks and uncertainty by different stakeholders (e.g. practitioners, patients, local population), in the context of medical exposures, industrial applications and natural radiation. This includes amplifier effects of practitioner’s knowledge |
| 1.6 Perception of radiological risks from low doses of radiation, accounting for cultural differences in routine, emergency and other exposure situations. |
| 1.7 Socio-psychological and economic aspects of medical follow-up after accidental or other exposures. |
Research line 2: Holistic approaches to governance of radiological risks

The research line 2 develops holistic and inclusive approaches for the governance of radiological risk situations by assessing non-radiological aspects (socio-economic, psychological and cultural), raising awareness about these aspects and integrating them into decision making. Evaluate and balance radiological and non-radiological aspects as input for decision-making. This includes assessing and including non-radiological detriment in risk governance.

Relevant topics include:

<table>
<thead>
<tr>
<th>Topics</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.1 Assessing values and expectations underlying ‘integration approaches,’ and the choices made in the name of SSH integration. This includes assessment of the limitations of risk governance as it is conceived of today, e.g. by examining which knowledge, approaches, frameworks cannot be transferred from one field to another.</td>
</tr>
<tr>
<td>2.2 Assessment of the synergetic effects (radiological and non-radiological) of radiation accidents (e.g. medical) through transdisciplinary research, and development of policy appraisal tools to inform decision-making.</td>
</tr>
<tr>
<td>2.3 Holistic approaches to accident preparedness, management and recovery, taking into account multiple risks, social, economic and psychological factors. These holistic approaches should account for the development of psychological support for evacuees as part of preparedness policies; socio-economic aspects of preventive distribution of iodine tablets in different EU countries; and psychological consequences of emergency management decisions.</td>
</tr>
<tr>
<td>2.4 Social and psychological issues related to preparedness and response to nuclear and radiological terrorism.</td>
</tr>
<tr>
<td>2.5 Ethical aspects of crisis situations, particularly ethical questions of evacuation, and post-accident management (“emergency ethics” vs. “normal ethics”), and the transition from emergency to existing radiation exposure situations.</td>
</tr>
<tr>
<td>2.6 Development of socio-economic valuation and multi-criteria decision aid methods to formally structure the evaluation and integration of radiological and non-radiological factors for different ionising radiation exposure situations.</td>
</tr>
<tr>
<td>2.7 Decision making mechanisms in post-accident situations, with emphasis on local knowledge and decision-making.</td>
</tr>
<tr>
<td>2.8 Policy analysis of how the Aarhus convention and other reference documents are mobilised in the radiation protection field and to which impact.</td>
</tr>
<tr>
<td>2.9 Democratic culture in radiation protection in order to construct joint actions with institutional and non-institutional actors.</td>
</tr>
<tr>
<td>2.10 Comparison of medical guidelines and principles of radiation protection with a view on the underlying ethical values.</td>
</tr>
<tr>
<td>2.11 Investigation of approaches to uncertainty in different professions (general practitioners, surgeon, food scientist, public).</td>
</tr>
<tr>
<td>2.12 Ethical perspective of compensation for damage incurred due to various situations of radiation exposure and differences among countries.</td>
</tr>
</tbody>
</table>
Research line 3: Guiding principles for Responsible Research and Innovation in Radiation Protection

Research line 3 aims at assessing how radiological protection research and development (R&D) is conducted, with the aim of inciting more socially responsive and ethically sound R&D and outcomes. This should enhance the impact of social science and humanities research on science and technology policy and research agendas in the field of radiation protection.

Relevant topics include:

<table>
<thead>
<tr>
<th>Topics</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.1 Enhancing the reflexive awareness of actors involved in R&amp;D about the societal implications of nuclear technology applications and radiation exposure situations that require radiation protection research.</td>
</tr>
<tr>
<td>3.2 Examining the social, cultural, and historical context of radiation protection research; the rationales, possibilities, and limitations of research approaches and methods; the social relevance of research hypotheses.</td>
</tr>
<tr>
<td>3.3 Ascertaining conflicts of interest in radiation protection research and finding ways to remedy such conflicts.</td>
</tr>
<tr>
<td>3.4 Identifying and developing sound ethical principles and approaches (e.g. deliberation) to guide radiation protection research in a socially responsive and responsible manner.</td>
</tr>
<tr>
<td>3.5 Operationalizing, as well as problematizing and developing, principles like trans-disciplinarity and holism, which sustain the integration of SSH into radiation protection research.</td>
</tr>
<tr>
<td>3.6 Evaluating the institutional uptake of research projects and findings.</td>
</tr>
<tr>
<td>3.7 Making the SSH integration meaningful and operational</td>
</tr>
<tr>
<td>3.8 Developing methodologies and tools for the dynamic mapping of stakeholders’ concerns, views and needs to identify R&amp;D priorities in the radiation protection field</td>
</tr>
</tbody>
</table>
Research line 4: Stakeholder engagement in radiation protection research, development, policy and practice

Research line 4 aims at fostering stakeholder engagement in radiation protection research, policy and practice in ways that enhance responsiveness to societal needs and concerns. By stakeholder we denote anyone who has a stake in radiation protection research, its development or applications and/or is potentially affected by radiation protection R&D and the outcomes it generates.

Relevant topics include:

<table>
<thead>
<tr>
<th>Topics</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.1 Mediation, facilitation and representation on the triangle scientists, public and other stakeholders (e.g. industry, elite, policy makers) for different exposure situations and nuclear applications, research and development, including lessons from Fukushima.</td>
</tr>
<tr>
<td>4.2 Establishment of a collaborative framework for stakeholder engagement (radiation protection experts, radiation protection policy makers, authorities and civil society organisations) in radiation protection research, policy and practice in ways that enhance responsiveness to societal needs and concerns. Particular focus on low radiation doses and related uncertainties.</td>
</tr>
<tr>
<td>4.3 Analysis of societal needs for and evaluation of legal instruments and governance frameworks supporting access to information, public participation and access to justice in relation with RP issues.</td>
</tr>
<tr>
<td>4.4 Examination, assessment and design of stakeholder and public participation tools and methodologies for different radiological exposure situations. Roles and rules of stakeholders in the engagement process. Motivational factors, ethics, and link between theory and practice.</td>
</tr>
<tr>
<td>4.5 Potential and pitfalls of citizen involvement in knowledge production for radiological risk governance.</td>
</tr>
<tr>
<td>4.6 Preservation of knowledge and experience of local stakeholders’ (e.g. local community, schools, citizens) involvement and participation. Community research and tracing for development of participation culture in relation to different exposure situations</td>
</tr>
</tbody>
</table>

Research line 5: Risk communication

The research line 5 aims at developing research to support communication about ionising radiation between different stakeholders and citizen-centred risk communication, in order to clarify choices and options in a variety of exposure situations and empower citizens and other stakeholders to make informed decisions.
Relevant topics include:

<table>
<thead>
<tr>
<th></th>
<th>Topics</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1</td>
<td>Risk communication about radioactivity and radiation protection principles in medical applications of ionizing radiation and the impact of communication on radiation protection behaviour of practitioners.</td>
</tr>
<tr>
<td>5.2</td>
<td>Improving decision-making through informed consent of patients for medical procedures involving ionising radiation; by empowering patients in decision making; ethical issues and communication about uncertainties.</td>
</tr>
<tr>
<td>5.3</td>
<td>Developing long term communication models to improve radiation protection culture and public well-being in long term exposure situations.</td>
</tr>
<tr>
<td>5.4</td>
<td>Use and perception of technical information and risk estimates in communication with various publics (lay people, experts, informed civil society).</td>
</tr>
<tr>
<td>5.5</td>
<td>Media communication about ionizing radiation, in particular low radiation doses and related uncertainties in the field of radiological protection including inter-media agenda setting in different exposure situations.</td>
</tr>
<tr>
<td>5.6</td>
<td>Ethical basis and values underpinning risk communication about ionizing radiation exposures,</td>
</tr>
<tr>
<td>5.7</td>
<td>Risk communication and stakeholder involvement in post-accident recovery in order support decision making process related to daily life and to improve public health.</td>
</tr>
<tr>
<td>5.8</td>
<td>Developing risk communication about low doses: Use of state of the art knowledge from mental models and other socio-psychological research with focus on low doses of ionizing radiation and related uncertainties.</td>
</tr>
<tr>
<td>5.9</td>
<td>Ethical principles guiding deliberative processes on questions that cannot be decided by radiation specialist alone: role of uninformed risk perceptions, applicability of informed consent, appropriateness of risk comparisons, dealing with refusal to communicate.</td>
</tr>
</tbody>
</table>

Research line 6: Radiation protection culture

The research line 6 supports the development and building of a radiation protection culture among stakeholders in various exposure situations (planned, existing and emergency) and categories of exposure (occupational, patient, general public). This should:

- favour the understanding of radiation protection norms and standards
- favour better decision-making processes concerning the management of radiation exposure situations, and identification and implementation RP actions
- enable individuals, where relevant:
  - to reflect on their own protection and/or that of other individuals
  - to consider consciously radiation protection aspects in their activities or decisions
  - to make their own decision with regard to their own protection against ionising radiations
  - to participate to decision making processes related to the management of exposure situations
enable professionals in RP field and other stakeholders to dialogue and share a common language, in a view to enhance the efficiency and reliability of the radiation protection system and its capacity to effectively answer the concerns of all concerned stakeholders.

Relevant topics include:

<table>
<thead>
<tr>
<th>Topics</th>
</tr>
</thead>
</table>

6.1 Characterization of RP culture, including
- Specificities associated with exposure situations;
- Organisational/societal/political/economic/ psychological aspects and value judgments influencing RP culture or RP behaviours;
- Cultural differences between countries;
- Ethical frameworks underlying RP cultures;
- Links between RP culture at the level of an organisation/community and the level of groups or individuals from this organisation/community;
- Impact of evolving RP technologies, knowledge or communication technologies on RP culture;
- Relationships between RP culture and safety culture (notably in the nuclear industry).

6.2 Criteria/methodologies/tools for the qualitative and quantitative evaluation of the level RP culture, at group and/or individual level

6.3 The role of RP culture, in particular
- The contribution of RP culture in the implementation and improvement of the protection “system”;
- How RP culture can improve health and well-being of populations?
- Practical achievements from developing/building a RP culture (impact on level of exposure, protective actions, decision making processes,...)

6.4 Development of tools, methods, processes to build, maintain and transmit RP culture
- Needs and concerns of stakeholders regarding RP culture, with attention to the development of participatory tools and low dose exposure situations.
- Development of tools/methods/processes to enhance RP culture in specific fields: emergency and late phase nuclear accident preparedness, NORM activities, Radon exposure, paediatric imaging;
- Processes to maintain/transfer RP culture through generations;
- Guidance for enhancing RP culture for specific publics (communities around nuclear installations, schools, patients, pregnant women, medical doctors);

6.5 Social, psychological and economic aspects of radiological protection choices by different actors.

This is an extracted chapter of the CONCERT deliverable D2.6 with the Ref. Ares(2016)6542352-22/11/2016
